

Separation of Concerns

A design principle: Isolate different parts of a program that address different concerns

A modular component can be developed and tested independently

Hog	Hog Game Simulator				
	• Game rules				
	Ordering of events				
	 State tracking to determine the winner 				

Game Commentary

- Event descriptions D
- State tracking to generate commentary

Player Strategies

- Decision rules
- Strategy parameters (e.g., margins & number of dice)

Ants

Ants Game Simulator

- Order of actions
- Food tracking
- Game ending conditions

Actions

 Characteristics of different ants & bees Tunnel Structure

- Entrances & exits
- Locations of insects

Example: Restaurant Search

Restaurant Search Data

```
Given the following data, look up a restaurant by name and show related restaurants.

{"business_id": "gclB3ED6uk6viWlo1Sb_uA", "name": "Cafe 3", "stars": 2.0, "price": 1, ...}

{"business_id": "WXKx2I2SEzBpeUGtDMCS8A", "name": "La Cascada Taqueria", "stars": 3.0, "price": 2}
...

{"business_id": "gclB3ED6uk6viWlo1Sb_uA", "user_id": "xVocUszkZtAqCxgWak3xVQ", "stars": 1, "text": "Cafe 3 (or Cafe Tre, as I like to say) used to be the bomb diggity when I first lived in the dorms but sadly, quality has dramatically decreased over the years....", "date": "2012-01-19", ...}

{"business_id": "WXKx2I2SEzBpeUGtDMCS8A", "user_id": "84dCHkhWG8IDtk30VvaY5A", "stars": 2, "text": "-Excuse me for being a snob but if I wanted a room temperature burrito I would take one home, stick it in the fridge for a day, throw it in the microwave for 45 seconds, then eat it. NOT go to a resturant and pay like seven dollars for one...", "date": "2009-04-30", ...}
...
```

(Demo)

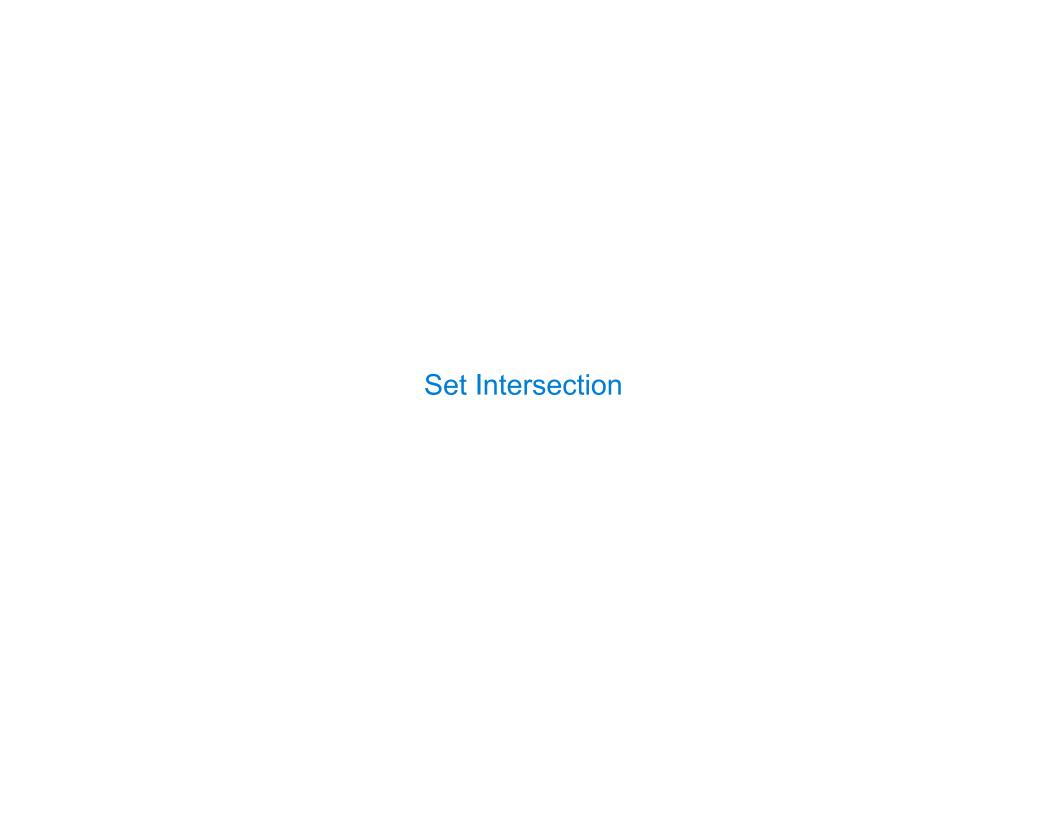

Example: Similar Restaurants

Discussion Question: Most Similar Restaurants

sorted(iterable, /, *, key=None, reverse=False)
Return a new list containing all items from the iterable in ascending order.
A custom key function can be supplied to customize the sort order, and the reverse flag can be set to request the result in descending order.

Example: Reading Files

(Demo)

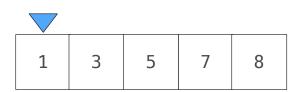

Linear-Time Intersection of Sorted Lists

Given two sorted lists with no repeats, return the number of elements that appear in both.

def fast_overlap(s, t):

3	4	6	7	9	10

(Demo)

Sets

```
One more built-in Python container type

    Set literals are enclosed in braces

    Duplicate elements are removed on construction

    Sets have arbitrary order

  >>> s = {'one', 'two', 'three', 'four', 'four'}
  >>> S
  {'three', 'one', 'four', 'two'}
  >>> 'three' in s
  True
  >>> len(s)
  >>> s.union({'one', 'five'})
  {'three', 'five', 'one', 'four', 'two'}
  >>> s.intersection({'six', 'five', 'four', 'three'})
  { 'three', 'four'}
  >>> S
  {'three', 'one', 'four', 'two'}
```
